

SettlementIQ

RodanIQ Platform

THE SETTLEMENT VALIDATION LAYER FOR IESO MARKET PARTICIPANTS.

Settlement errors in the IESO do not announce themselves. They surface inside preliminary statements, get carried into final settlement, and become unrecoverable once the six-business-day Notice of Disagreement window closes. By the time a discrepancy is found, the dispute is closed and the revenue is gone.

SettlementIQ is a managed service. Rodan's settlement team shadows your IESO statements daily, comparing them against your interval meter data, totalization tables, and bid history. Discrepancies are flagged in time to file inside the NOD window. Two tiers: monthly review for most facilities, daily verification for operators with daily-settled positions.

A 75 MW / 300 MWh asset at MRP prices can leak hundreds of thousands of dollars annually through unvalidated settlements.

What the settlement team does

Rodan's settlement team compares the IESO's preliminary and final statements against your interval meter data, totalization tables, and bid submissions. The team isolates the charge types where the numbers do not reconcile and delivers a comparison report your team can act on inside the dispute window.

Discrepancies caught inside the dispute window

The IESO publishes preliminary settlement statements with a six-business-day Notice of Disagreement window. Most settlement errors that go unrecovered are not missed entirely. They are found after the window closes. SettlementIQ exists to find them while they are still recoverable.

The validation layer for revenue you already earn

Demand response payments, capacity payments, and energy market settlements are only as accurate as the validation behind them. SettlementIQ pairs with FlexOps to validate dispatch outcomes, with Demand Response to verify program payments, and with GridOps to confirm metering data is reconciled before it reaches settlement. The revenue captured by the rest of Rodan's stack is protected here.

Two service tiers, configured to your settlement cycle

Monthly review fits most C&I facilities and load participants. Daily verification fits power producers and BESS operators with daily-settled positions where every operating day carries settlement exposure. Both tiers operate inside the IESO's NOD window and deliver findings the customer's finance or operations team can file directly.

BUILT FOR THE TEAMS WHO OWN SETTLEMENT ACCURACY.

Energy Managers

Multi-site facilities in the IESO with Class A exposure or DR participation. Settlement discrepancies surfaced inside the dispute window, with the documented evidence finance needs to file.

Financial Analysts

Settlement discrepancies and program payment variances documented inside the dispute window. Finance can file before close instead of writing off small variances at audit.

Operations Teams

For DR participants and FlexOps customers, dispatch performance during events traced to the program payment it produced. Settlement validation closes the loop on operations work.

Power Producers and market participants

For IESO-registered IPPs, BESS operators, and capacity participants, daily verification catches settlement variances on operating days where every interval matters. Energy market revenue, capacity payments, and Operating Reserve compensation reconciled against actual delivered performance.

What this is worth

For a Class A facility, a single undetected metering or peak-allocation error can cost tens of thousands of dollars over the IESO base period. For a power producer, a missed dispatch settlement or capacity payment variance compounds across the contract year. The settlement team finds these discrepancies inside the dispute window, where they are still recoverable.

Available in IESO. Pairs with FlexOps, Demand Response, and GridOps

The same Rodan settlement team that runs SettlementIQ also handles settlement validation embedded in FlexOps for power producers and BESS operators, and embedded in Demand Response for participating C&I facilities. SettlementIQ is for organizations who want the validation discipline without a full operations engagement.

BOOK A BUSINESS VALUE ASSESSMENT

Share three months of IESO settlement statements and your interval meter data. Rodan's settlement team will return findings on charge types where the numbers do not reconcile, the value at risk inside the current dispute window, and which tier fits your settlement cycle.
